1. OVERVIEW

This manual explains the performance specifications, names and settings of each part, and the error codes for the Q2ASCPU, Q2ASCPU-S1, Q2ASHCPU and Q2ASHCPU-S1 (hereinafter, Q2ASCPU).

Refer to the Type A1SC24-R2/A1SH/A2SHCPU(S1)/A2ASCPU(S1/S30) User's Manual (Hardware) IB-66468 enclosed with the base unit for details on the Q2ASCPU safety precautions, general specifications, mounting and installation methods, EMC Directives, Low-voltage Directives and the input/output module specifications and connection methods.

When using the Q2ASCPU with the A1S38HB/A1S38HBEU, refer to the Q2AS(H)CPU (S1) User's Manual (Hardware) enclosed with the base unit. (All of the contents of this manual are given in the User's Manual.)

2. PERFORMANCE SPECIFICATION

2.1 Q2ASCPU Module Performance Specification

Performance specification of Q2ASCPU module is as follows:

Item		Model				Remark
		Q2ASCPU	Q2ASCPU-S1	Q2ASHCPU	Q2ASHCPU-S1	
Control method		Repetitive operation of stored program				
I/O control method		Refresh mode				I/O enabled by specifying direct I/O (DX□, DY□)
Programming language		Sequence control dedicated language				
		Relay symbol language, logic symbolic language, MELSAP3 (SFC)				
Processing speed (sequence instructions) (us/step)	LD	0.2		0.075		
	MOV	0.6		0.225		
Number of instructions (type)	Sequence instructions	39				
	Basic instructions	230				
	Application instructions	321				
	Special dedicated instructions	171				
Constant scan (ms) (Function that makes scan time constant)		5 to 2000 (configurable in multiple of 5 ms module)				Set parameter values to specify
Memory capacity		Capacity of loading memory cards (2036 kbyte maximum)				
Program capacity	Number of steps (steps)	28 k maximum	60 k maximum	28 k maximum	60 k maximum	
	Number of files (files)	28	60	28	60	
I/O device points (points)		8192 (X/Y0 to 1FFF)				Number of usable points in program
I/O points (points)		512 (X/Y0 to 1FF)	1024 (X/Y0 to 3FF)	512 (X/Y0 to 1FF)	1024 (X/Y0 to 3FF)	Number of points accessible to actual I/O modules
Clock function		Year, month, date, hour, minute, second, day of week (auto-detects leap years) Accuracy : -1.7 to +4.9s (TYP. +1.7s) / d at 0 depress centigrade Accuracy : -1.0 to +5.2s (TYP. +2.2s) / d at 25 depress centigrade Accuracy : -7.3 to +2.5s (TYP. -1.9s) / d at 55 depress centigrade				
Allowable momentary power failure period		By power supply module				
5 VDC Internal current consumption (A)		0.3	0.3	0.7	0.7	
Mass kg		0.5	0.5	0.5	0.5	
External dimension (mm (inch))		130(H) × 54.5(W) × 110(D) (5.12 × 2.15 × 4.33)				

3. PART NAMES AND SETTINGS

3.1 Part names and Settings

This section describes the name and setting of each part of the module.

Q2ASCPU, Q2ASCPU-S1, Q2ASHCPU, Q2ASHCPU-S1

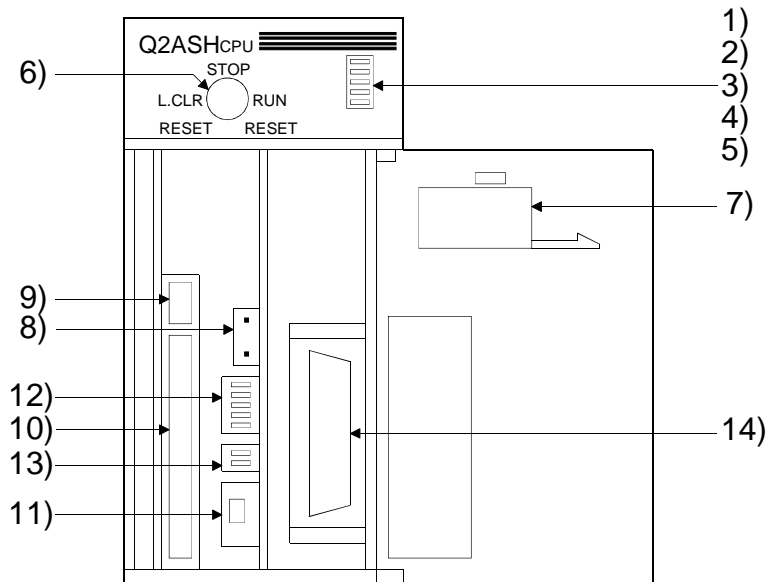

Illustration of the module with the front cover open

No.	Name	Application
1)	RUN LED	<p>This LED indicates the CPU module operating condition.</p> <p>Lit :Operating with the RUN/STOP key switch set to RUN or STEP-RUN.</p> <p>Off :Stopped with the RUN/STOP key switch set to STOP, PAUSE, or STEP-RUN.</p> <p>Or, the CPU module has detected the error that would cause the operation to stop.</p> <p>Flash :The RUN/STOP key switch has been set from STOP to RUN after the program was written in stop mode.</p> <p>The CPU module is not in RUN mode. To engage the CPU module in RUN mode, set the RUN/STOP key switch to RUN, STOP, the RUN. Alternatively, reset the module using the key switch.</p>
2)	ERROR LED	<p>Lit :A self-diagnostic error (other than a battery error) that will not stop operation has been detected. (The parameter has been set to Continue operation at error detection.)</p> <p>Off :Normal</p> <p>Flash :An error that will stop the operation has been detected.</p>
3)	USER LED	<p>Lit :A error has been detected by the CHK instruction, or annunciator F has been turned ON.</p> <p>Off :Normal</p> <p>Flash :The latch clear operation has been executed.</p>
4)	BAT. ALARM LED	<p>Lit :Battery error has occurred due to a drop in the CPU module main unit/memory card battery voltage.</p> <p>Off :Normal</p>
5)	BOOT LED	<p>Lit :The boot operation has been completed.</p> <p>Off :The boot operation has not been executed.</p>

No.	Name	Application																		
6)	RUN/STOP key switch	<p>RUN/STOP :Executes/stops the operation of the sequence program.</p> <p>L.CLR :Sets the entire data of the latch area specified by the parameter to OFF or 0. Clears the entry of the sampling trace and the status latch.</p> <p>RESET :Executes the hardware reset operation and the reset at an operation error occurrence, and initializes the operation.</p>																		
7)	Battery (A6BAT)	Backup battery to be used for the internal RAM and the power failure compensation function.																		
8)	Battery connector pin	Used to connect the battery lead wire. (The lead wire is removed from the connector at shipment in order to prevent battery consumption.)																		
9)	Memory card EJECT button	Used to eject the memory card from the CPU module.																		
10)	Memory card loading connector	This connector is used to load the memory card in the CPU module.																		
11)	Memory card Load/eject switch (LED equipped)	<p>This switch setting determines whether or not you can load/eject the memory card during energizing. The factory default setting is OFF.</p> <p>ON :Loading is prohibited. (LED is lit.)</p> <p>OFF :Loading is allowed. (LED is turned off.)</p>																		
12)	System setting switches 1 	<p>These switches allow you to set the items for the CPU module operation. The factory default setting of all switches is OFF.</p> <p>SW5 :Boot setting. This switch allows you to select the memory for operation.</p> <p>ON :Boot operation</p> <p>OFF :Boot operation is not performed</p> <p>SW2 to 4 :Parameter area. These switches allow you to select the memory into which to write the parameters.</p>																		
		<table border="1"> <thead> <tr> <th rowspan="2"></th> <th rowspan="2">Internal RAM</th> <th colspan="2">Memory card</th> <th rowspan="2">SW2 to 4 are valid if SW1 is OFF.</th> </tr> <tr> <th>RAM</th> <th>ROM</th> </tr> </thead> <tbody> <tr> <td>SW4</td> <td>OFF</td> <td>ON</td> <td>OFF</td> <td rowspan="3"></td> </tr> <tr> <td>SW3</td> <td>OFF</td> <td>OFF</td> <td>ON</td> </tr> <tr> <td>SW2</td> <td>OFF</td> <td>OFF</td> <td>OFF</td> </tr> </tbody> </table> <p>SW1 :System protect. Writing to the CPU module and issuing the control instructions are prohibited.</p> <p>ON :System protect is valid.</p> <p>OFF :System protect is invalid.</p>		Internal RAM	Memory card		SW2 to 4 are valid if SW1 is OFF.	RAM	ROM	SW4	OFF	ON	OFF		SW3	OFF	OFF	ON	SW2	OFF
	Internal RAM	Memory card			SW2 to 4 are valid if SW1 is OFF.															
		RAM	ROM																	
SW4	OFF	ON	OFF																	
SW3	OFF	OFF	ON																	
SW2	OFF	OFF	OFF																	
13)	System setting switches 2 	<p>These switches allow you to set the items for CPU module operation. The factory default setting of all switches is OFF.</p> <p>SW2 :Unused (Fixed to OFF)</p> <p>SW1 :Peripheral protocol. This switch allows you to select the type of peripheral devices that are connected to the CPU modules peripheral interface.</p> <p>(Set this switch to ON when you wish to access another stations ACPU from the ACPU peripheral device. The setting becomes effective as soon as you set the switch.)</p> <p>ON :Peripheral device for the ACPU</p> <p>OFF :Peripheral device for the Q2ASCPU</p>																		
14)	RS-422 connector	Used to connect a peripheral device.																		

3.2 Relationship between switch operation and the LED indication

(1) Writing a program while the CPU module is stopped:

Follow the procedure below to write a program while the CPU module is stopped:

(a) RUN/STOP key switch: STOP

RUN LED: Off CPU module is in STOP mode. → Write a program.

(b) RUN/STOP key switch: RESET

RUN LED: Off CPU module is in STOP mode.

(c) RUN/STOP key switch: STOP → RUN

RUN LED: Lit CPU module is in RUN mode.

POINT
<ul style="list-style-type: none">• After writing a program (except for online program write), perform reset operation, and then place the CPU module in the RUN status.• When remote STOP is switched to RUN, the CPU module is not put in the "PROG CHECK" status but is placed in the RUN status.

(2) Latch clear operation:

Operate the RUN/STOP key switch as follows to execute the latch clear operation:

(a) Turn the RUN/STOP key switch of the CPU module from the "STOP" position to the "L. CLR" position several times to flicker the "USER LED" on the CPU module front.

Normally, the LED flickers when the switch is turned several times (three or four times).

When the "USER LED" flickers, it indicates that latch clear is ready.

(b) After the "USER LED" has flickered, turning the RUN/STOP key switch from the "STOP" position to the "L. CLR" position again executes latch clear and lights up the "USER LED".

If the "USER LED" comes on for two seconds and then goes off, it indicates that latch clear is completed normally.

(c) To cancel latch clear midway, turn the RUN/STOP key switch to the "RUN" position to place the CPU module in the RUN state, or turn it to the "RESET" position to make a reset.

POINT
<ul style="list-style-type: none">• You can make latch clear valid or invalid for each device via the device setting in parameter mode.• Instead of using the RUN/STOP key switch, you can also execute the latch clear operation remotely from the peripheral GPP function device. (Refer to the Q2AS(H)CPU(S1) User's Manual (Detailed Manual).)

(3) Removing the memory card while the PLC power is on:

Operate the memory card load/eject switch as described below the memory card while the PLC power is still on:

(a) Load/eject switch: ON,

Load/eject switch internal LED: Lit.....Ejecting the memory card is prohibited.

(b) Load/eject switch: OFF,

Load/eject switch internal LED: Off.....Ejecting the memory card is allowed.

.....→ Remove the memory card.

POINT
<ul style="list-style-type: none">• The load/eject switch internal LED may not be turned off when you are using the memory card for the CPU module system function (such as sampling trace and status latch) or for the program. In this case, quit the corresponding system function or program that is using the memory card. Then, make sure that the load/eject switch internal LED is turned off, and remove the memory card.• Do not turn on the memory card load/eject switch after you have removed the memory card. Otherwise, an error will occur.• When there are parameter-set file registers, local devices or failure history, the memory card cannot be removed. If the "memory card in/out" switch is turned OFF, the in/out switch built-in LED does not go off. For the file registers, the memory card can be removed when they are set to be unused with the QDRSET(P) instruction.

(4) Loading the memory card while the PLC power is on:

Operate the memory card load/eject switch as described below to load the memory card while the PLC power is still on:

(a) Load the memory card.

(b) Load/eject switch: ON,

Load/eject switch internal LED: Lit.....Ejecting the memory card is prohibited.

POINT
<ul style="list-style-type: none">• Be sure to turn on the memory card load/eject switch after you have loaded the memory card. Otherwise, you will not be able to use the card.• Since mount processing is performed again after the memory card is inserted, note that the scan time of one scan when mount processing is performed increases by a maximum of 10ms.

4. ABOUT FAIL-SAFE CIRCUITS

4.1 About Fail-safe Circuits

When the PLC is powered on and off, normal control output may not be done momentarily due to a delay or a start-up time difference between the PLC power supply and the external power supply (DC in particular) for the control target.

For example, if the external power supply for the controlled object is switched on in a DC output module and then the PLC power supply is switched on, the DC output module may provide false output instantaneously at power-on of the PLC. Therefore, it is necessary to make up a circuit that can switch on the PLC power supply first.

Also, an abnormal operation may be performed if an external power supply fault or PLC failure takes place.

To prevent any of these abnormal operations from leading to the abnormal operation of the whole system and in a fail-safe viewpoint, areas which can result in machine breakdown and accidents due to abnormal operations (e.g. emergency stop, protective and interlock circuits) should be constructed outside the PLC.

The next page shows an example of the system design circuits, based on the considerations described above.

 DANGER

- Install a safety circuit external to the PLC that keeps the entire system safe even when there are problems with the external power supply or the PLC module. Otherwise, trouble could result from erroneous output or erroneous operation.
 - (1) Outside the PLC, construct mechanical damage preventing interlock circuits such as emergency stop, protective circuits, positioning upper and lower limits switches and interlocking forward/reverse operations.
 - (2) When the PLC detects the following problems, it will stop calculation and turn off all output in the case of (a). In the case of (b), it will stop calculation and hold or turn off all output according to the parameter setting. Note that the AnS series module will turn off the output in either of cases (a) and (b).
 - (a) The power supply module has over current protection equipment and over voltage protection equipment.
 - (b) The CPU module self-diagnostic functions, such as the watchdog timer error, detect problems. In addition, all output will be turned on when there are problems that the CPU module cannot detect, such as in the I/O controller. Build a fail safe circuit exterior to the PLC that will make sure the equipment operates safely at such times.
 - (3) Output could be left on or off when there is trouble in the outputs module relay or transistor. So build an external monitoring circuit that will monitor any single outputs that could cause serious trouble.
- Build a circuit that turns on the external power supply when the PLC main module power is turned on. If the external power supply is turned on first, it could result in erroneous output or erroneous operation.
- When there are communication problems with the data link, refer to the corresponding data link manual for the operating status of each station. Not doing so could result in erroneous output or erroneous operation.

 DANGER

- When connecting a peripheral device to a CPU module, or a PC to an intelligent function module to control a PLC in operation (data change), configure an interlock circuit on the sequence program so that the entire system operates safely at any time. Also before exercising other control (program change, operating status change (status control)) on the running PLC, read the manual carefully and fully confirm safety. Especially for the above control on the remote PLC from an external device, an immediate action may not be taken for PLC trouble due to a data communication fault. In addition to configuring up the interlock circuit in the sequence program, corrective and other actions to be taken as a system for the occurrence of a data communication fault should be predetermined between the external device and PLC CPU.

 CAUTION

- Do not bunch the control wires or communication cables with the main circuit or power wires, or install them close to each other. They should be installed 100 mm (3.94 inch) or more from each other. Not doing so could result in noise that would cause erroneous operation.
- When controlling items like lamp load, heater or solenoid valve using an output module, large current (approximately ten times greater than that present in normal circumstances) may flow when the output is turned OFF to ON. Take measures such as replacing the module with one having sufficient rated current.

(1) Examples of system design circuits

FOR AC

FOR AC/DC

Follow the procedure below to start up the power supply:

For AC

- 1) Turn the power ON.
- 2) Set the CPU module RUN.
- 3) Set the start switch to ON.
- 4) Turn ON the magnetic contactor (MC) and drive the output device using the program.

For AC/DC

- 1) Turn the power ON.
- 2) Select the CPU module RUN.
- 3) When the DC power is established, turn RA2 ON.
- 4) When 100% of the DC power is established, set the timer (TM) to ON.
(The TM value should be the time required from when RA2 is turned ON until 100% of the DC voltage is established. Set the value to 0.5 seconds.)
- 5) Set the start switch to ON.
- 6) Turn ON the magnetic contactor (MC), and drive the output equipment using the program.
(When you are using a voltage relay for RA2, the timer (TM) on the program is not required.)

(2) Fail-safe action during PC malfunction

Although a malfunction of the PC's CPU module and memory can be usually detected by the self-diagnostic function, the CPU module sometimes cannot detect a malfunction if the I/O controller is faulty.

In this case, depending on the degree of the malfunction, all devices might turn on or off, or you might have a situation in which you cannot maintain normal operation or safety of the controlled item.

We have done our best to maintain the highest quality as a manufacturer. However, should the PC become defective for some reason, configure an external fail-safe circuit to prevent mechanical damages and possible accidents.

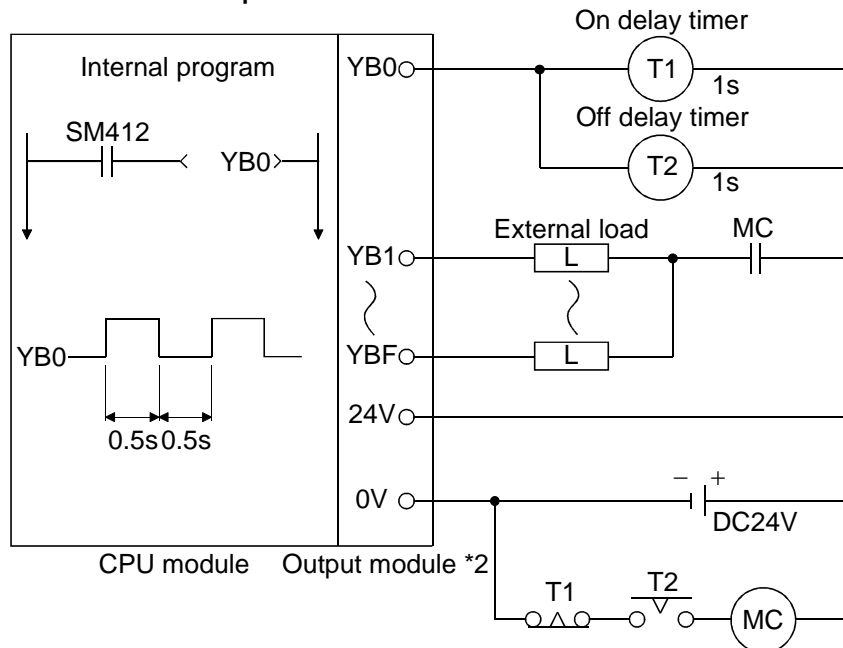

Examples of a system and its fail-safe circuitry are described below:

<System example>

*1: The output module for fail-safe purpose should be loaded in the last slot of the system. (YB0 to YBF in the above system.)

<Fail-safe circuit example>

*2: YB0 will repeats turning ON and OFF with an interval of 0.5 seconds . Use a contactless output module (the example above uses a transistor.).

5. ERROR CODES

The Q2ASCPU uses the self-diagnostic function to display an error code (LED indicator) and store the error information in the special relay SM and the special register SD, if an error occurs when the power is turned on to the PC or when the PC starts or running.

This chapter explains the details of errors that could occur on the Q2ASCPU and how to take a corrective action against them.

REMARK

The error code of the error that occurred when a general data processing request is made from the peripheral device, special function module or network system is not stored into SD0 of the Q2ASCPU.

The error code is returned to the source of the general data processing request.

5.1 Reading Error Codes

When an error occurs, the error code or error message, etc., can be read out at GPP function. For details regarding the GPP function operation procedure, refer to the GX Developer OPERATING MANUAL or SW□IVD-GPPQ OPERATING MANUAL.

5.2 Error Code List

The following information deals with error codes and the meanings, causes, and corrective measures of error messages.

<Relevant CPU>

- : Indicates all the QnACPU and QCPU.
- QCPU : Indicates all the Q series CPU modules.
- Q00J/Q00/Q01 : Indicates the Basic model QCPU.
- Qn(H) : Indicates the High Performance model QCPU.
- QnPH : Indicates the Process CPU.
- QnPRH : Indicates the Redundant CPU.
- QnA : Indicates the QnA series and Q2ASCPU series.
- Rem : Indicates the MELSECNET/H remote I/O modules.

Each CPU module model name: Indicates the relevant specific CPU module.

(Example: Q4AR, Q2AS)

Error Code (SD0)*1	Error Messages	Common Information (SD5 to 15)	Individual Information (SD16 to 26)	LED Status		Operating Statuses of CPU	Diagnostic Timing	
				RUN	ERROR			
1000	MAIN CPU DOWN	----	----	Off	Flicker	Stop	Always	
1001

6. TRANSPORTATION PRECAUTIONS

When transporting lithium batteries, make sure to treat them based on the transport regulations.

6.1 Controlled Models

The batteries for the MELSEC-QnA series CPU module (including memory cards) are classified as follows:

Product name	Model	Product supply status	Classification for transportation
QnA series battery	A6BAT	Lithium battery	Non-dangerous goods
QnA series memory card	Q1MEM-128S, Q1MEM-128SE, Q1MEM-1MS, Q1MEM-1MSE, Q1MEM-1MSF, Q1MEM-256S, Q1MEM-256SE, Q1MEM-256SF, Q1MEM-2MS, Q1MEM-2MSF, Q1MEM-512S, Q1MEM-512SE, Q1MEM-512SF, Q1MEM-64S, Q1MEM-64SE	Packed with lithium coin battery (BR2325)	

6.2 Transport Guidelines

Comply with IATA Dangerous Goods Regulations, IMDG code and the local transport regulations when transporting products after unpacking or repacking, while Mitsubishi ships products with packages to comply with the transport regulations.

Also, contact the transporters.

Warranty

Mitsubishi will not be held liable for damage caused by factors found not to be the cause of Mitsubishi; machine damage or lost profits caused by faults in the Mitsubishi products; damage, secondary damage, accident compensation caused by special factors unpredictable by Mitsubishi; damages to products other than Mitsubishi products; and to other duties.

⚠ For safe use

- This product has been manufactured as a general-purpose part for general industries, and has not been designed or manufactured to be incorporated in a device or system used in purposes related to human life.
- Before using the product for special purposes such as nuclear power, electric power, aerospace, medicine or passenger movement vehicles, consult with Mitsubishi.
- This product has been manufactured under strict quality control. However, when installing the product where major accidents or losses could occur if the product fails, install appropriate backup or failsafe functions in the system.
